Auslöser #1: Feinstaub ist problematisch

TODO: Headlines or health effects from Birgit

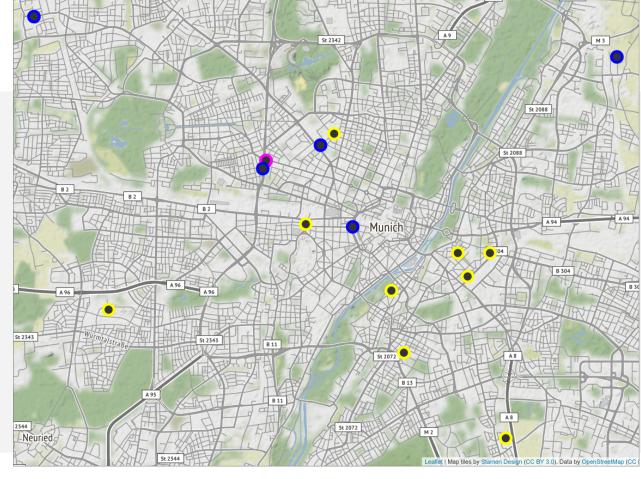

Auslöser #2: wenig Daten

https://data.hawadawa.com/dataset/visualisations/resource/af3a9461-6ccb-4c06-8fdf-2404fca37969/view/d3d8e21a-3022-4a0e-893c-e3261eb41251

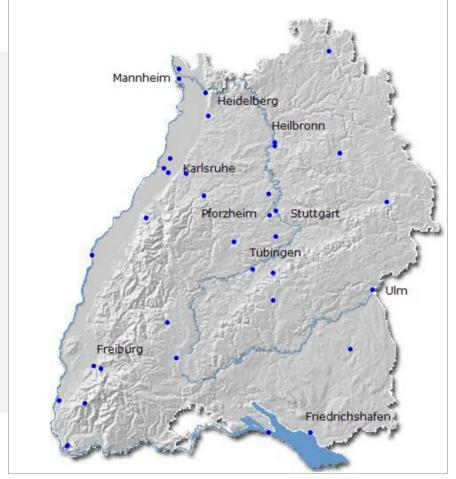

Auslöser #2:wenig Daten

Aktuelle Immissionsdaten in Baden Württemberg

http://mnz.lubw.baden-wuerttemberg.de/messwerte/aktuell/

Ansatz: selber messen übers Community

- Gerät, software (Firmware) und Server (DB Empfang, Archivieren, Kartedarstellung) entwickeln
- Baupläne und Software verteilen
- Daten zur Verfügung stellen
- Community unterstützen → Selbstläufer
 - (Workshops usw.)

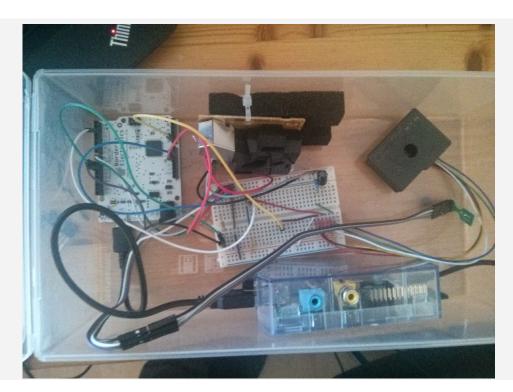

Prototyp!

https://lists.okfn.org/pipermail/codefordecitizenscience/2015-April/000006.html

Aktuelles Design

- 1: Das Rohr als Gehäuse 2 Rohrbögen zusammen ergeben den Wetterschutz für den Sensor
- 2: Der Sensor SDS011, der misst schon die richtigen Partikel PM10 und PM2,5
- 3: Der NodeMCU = ESP8266, eine WLAN Chip mit einem Computer, dort kommt die Firmware drauf
- 4: Der Anschluss: Spannung über ein Steckernetzteil 5V USB auf Micro-USB und eine WLAN Verbindung

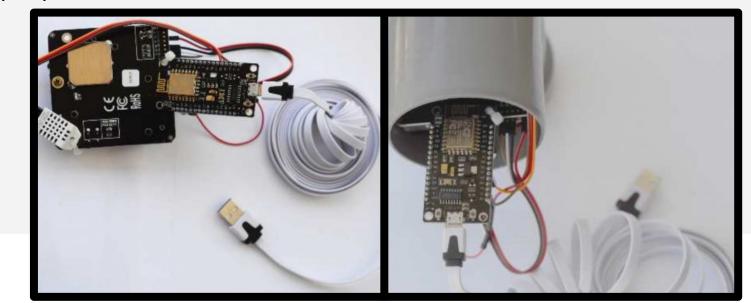

Und wie, selber bauen?

- 1) NodeMCU Firmware flaschen (ausführliche Anleitung unter luftdaten.info)
- 2) Sensor(en) andocken, ins Röhrchen stecken

Und wie, selber bauen?

- 3) Gerät konfigurieren
- 4) Per Email anmelden

Und, wo fange ich an?

Infos an Stand von Hawa Dawa (81)

Beim Workshop mitmachen

(https://www.meetup.com/de-DE/code-for-muenchen/)

Auf dem Laufenden bleiben: https://luftdaten.slack.com

Jetzt!? Sofort!

- Bauteile und Hilfe sind im Verschwörhaus (http://weinhof9.de/) in Ulm vorhanden

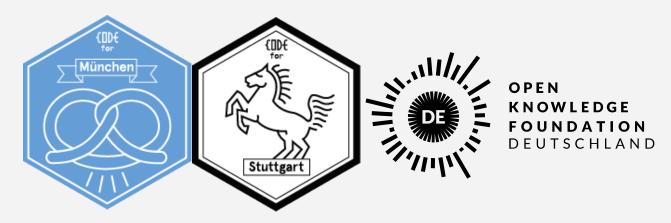

Feinstaub selber messen
